Exploratory Data Analysis (EDA)

To understand the dataset before building a model

Data collection

- Gather data from different sources.
- Ensure the data is relevant & complete.

Data cleaning

- Remove missing values and duplicates
- Correct inconsistent

Data visualization

- Select Use charts
- Detect outliers & relationships

Feature Engineering

- Select important features
- Transform data.

Model Building

- Apply algorithms such as LR, DT, RF
- Learn patterns
- Train ML model using data

Train-Test split

- Training data builds the model
- Testing data checks model performance

Model Training

- Apply algorithms.
- Learn patterns.

Model evaluation

- Measure performance & compare different models

Prediction

- Use the trained model to predict outcomes for new data.
